Weed Management

Brad Hanson Cooperative Extension Weed Specialist

UC WEED
SCIENCE
UNIVERSITY OF CALIFORNIA

Why control weeds?

- Compete for water, nutrients, and light with trees
- Interference is especially problematic during establishment years
- Can affect crop management, irrigation, and harvest operations
- Impacts on other pest problems
- Crop quality concerns?

Complex populations

- Rarely just one weed species present
 - Annual vs perennial vs biennial
 - Grass vs sedges vs broadleaf
- Time of emergence
 - Fall vs spring emergence vs year-round
- Reproductive strategy
 - Seed vs vegetative

Factors affecting orchard weeds

- Orchard age and arrangement
 - Shading and space capture
- Irrigation type, timing, and amount
 - Furrow, sprinklers, micros, drip
- Tillage practices
 - Berms, cross-disking, etc.
- Herbicide options
- Orchard access

Integrated weed management

- Using all available strategies to manage weed populations in a manner that is economically and environmentally sound.
 - cultural
 - mechanical
 - chemical

Goals of IWM

- Both short- and long-term goals
 - Prevent or reduce weed spread
 - Delay and/or suppress weed growth
 - Prevent or suppress weed seed production
 - Reduction of weed seed bank in soil

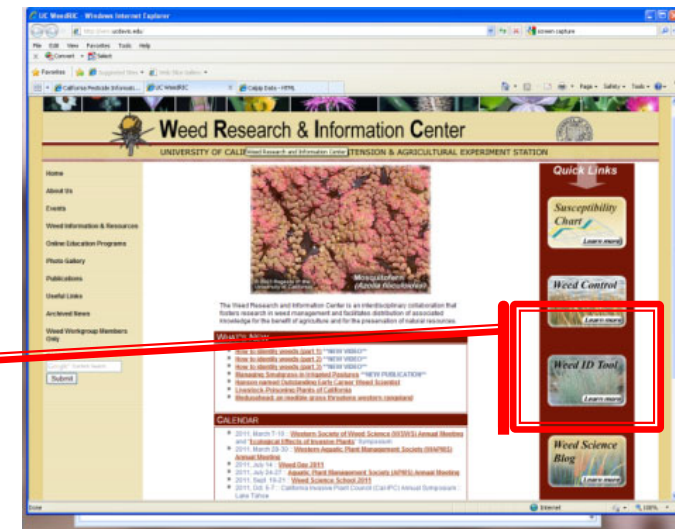

Weed identification

- Unknown weeds cannot be properly managed
 - No technique controls all weed species
 - Not all weeds cause equal damage (thresholds)
 - Species respond differently to control strategies
 - Even variants within a species (i.e. herbicide resistant biotypes)

Weed Research and Info Center
<http://wric.ucdavis.edu>

Online weed ID tool

Weed ID books and pamphlets

A number of weed books are available

Weed ID - software

Several available.

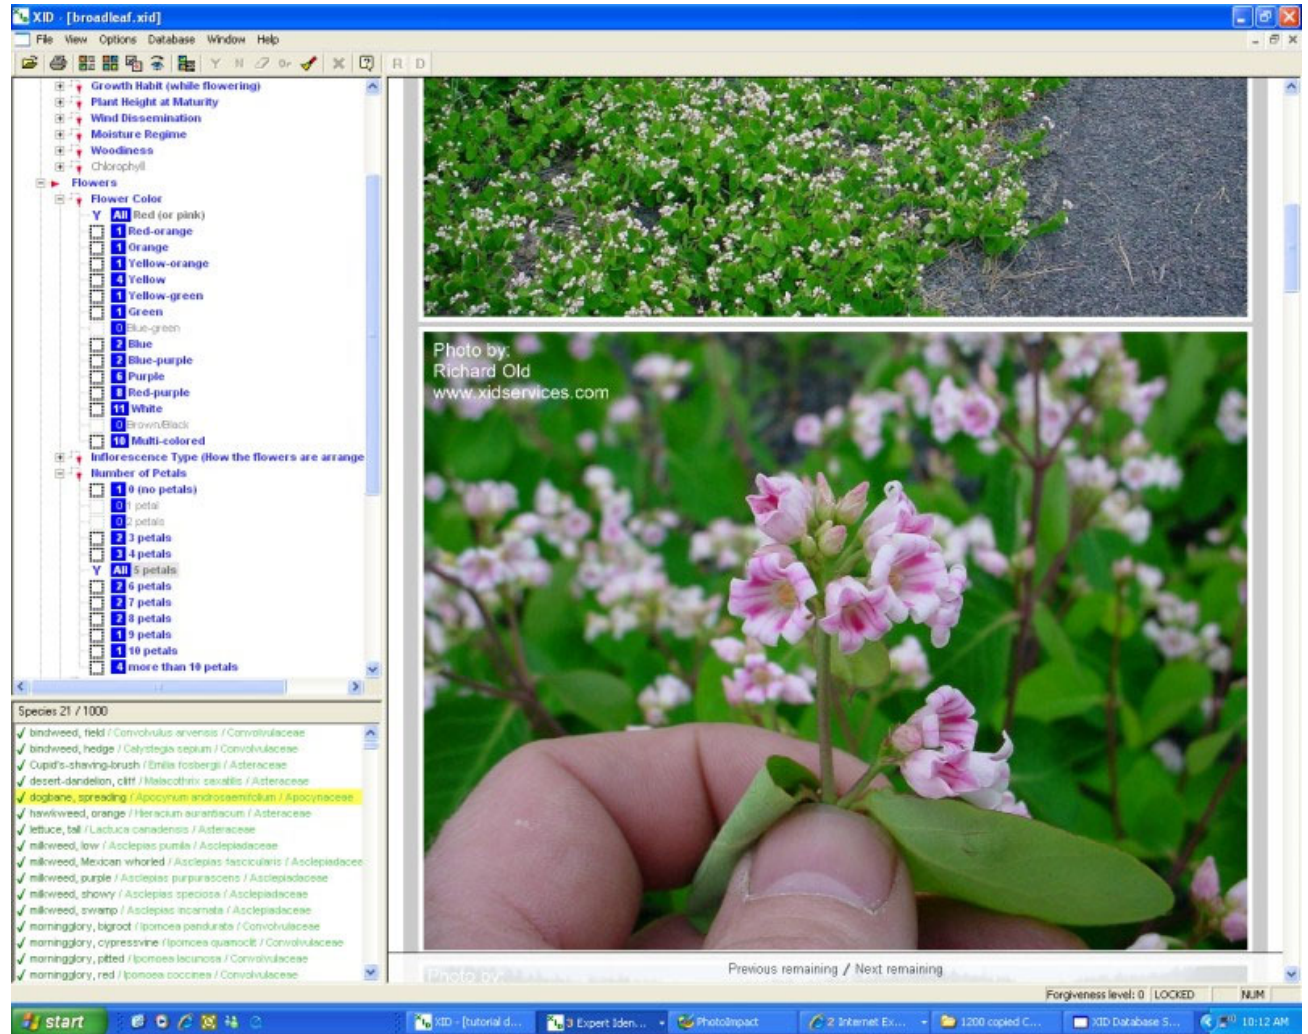

I use a set by XID Services

- UC Davis
- WSSA
- WSWS
- others

INCLUDES:

- Color photographs of all 1,200 species over 6,200 images.
- Graphic images of all terms and botanical structures used in the identification process.
- A complete step-by-step tutorial, to help you learn all of the program features.
- Close references to over 50 of the most common references.
- County weed data for each species.

Online weed ID resources

A few online (FREE) resources are available

The screenshot shows a web browser window displaying the University of Wisconsin Weed Identification & Management website. The page title is "University of Wisconsin - Weed Identification & Management - Windows Internet Explorer". The address bar shows the URL "http://weedid.wisc.edu/ca/weeid.php". The page content includes a search bar with the text "search database" and a message stating "Your database search has yielded 27 possible matches found in (CA)". Below this message is a table with three columns: "Scientific Name", "Common Name", and "Pictures". The table lists three weed species with their respective scientific and common names and small images of each.

Scientific Name	Common Name	Pictures
Abutilon theophrasti	velvetleaf	
Cardamine hirsuta	hairy bittercress	
Chenopodium album	common

The UC Guide to Healthy Lawns

[Back to start](#)

Begin key

Which illustrated characteristic best matches your weed species?

Leaves are wide, veins branch out in different directions

Leaves are narrow, arranged in sets of 2; stems are rounded or flattened

Leaves are narrow, arranged in sets of 3; stems are triangular in cross section

[Grass ID characteristics](#)
[Sedge ID characteristics](#)
[Broadleaf ID characteristics](#)

Weed management

- Orchard and vineyard floors divided into two management zones: middles and crop row
 - Zones may have very different strategies
 - Also may differ during the life of the orchard

How do we manage weeds?

- A few broad categories
 - Exclusion/sanitation
 - Cultural
 - Mechanical
 - Biological
 - Chemical

Sanitation

- Weed management should be an ongoing concern
 - Scout and manage in the orchard
 - Manage weeds on field margins and access roads
 - Clean equipment between sites
 - Scout and prevent seed set of “new” problems

Cultural practices

- Irrigation and fertilizer management
- Canopy management
- Cover crops
- Mulches
- Flaming
- Animals

Cover crops

Cover crop issues

ADVANTAGES

- Winter orchard access
- Reduced soil erosion
 - And pesticide and fertilizer runoff
- Addition of OM
- Soil structure and water/root penetration
- Competes with weeds

DISADVANTAGES

- Need to manage 2nd crop
 - More equipment
- Competes for water and nutrients
- Frost concerns
- Vertebrate and insect pests
- Addition of nutrients (N) may be unwanted (vineyard)

Flaming / heating

- Non-chemical
- High fuel cost
- Just need to “heat” not “burn” weeds
- Best on young broadleaf
- No residual control
- Danger of damage to young trees or vines and irrigation systems

Animals

- Animals can be used to manage vegetation in some cases
 - Can work very well ... or very poorly
 - Expensive (own or rent?)
 - Management effort
 - Animal health and welfare limits weed control
 - Can damage trees or vines (buds) if left too long
 - Food safety concerns

Mechanical control

- Tillage / cultivation
- Mowing
- Hand labor

- T&V rows vs middles
 - equipment options and costs

Tillage/Cultivation

ADVANTAGES

- Non-chemical tactic
- Organic matter additions and nitrogen release
- Reduces competition for water
- Reduces frost potential
- Easy control in middles
- No “resistance”

DISADVANTAGES

- Fuel and time costs
- Trunk and root injury
- Dust
- Erosion
- Compaction
- Can spread seed and fragments
- Weeds near tree difficult
- Effects on tree vigor?

Mowing

- **Advantages.**

- Suppresses weeds, reduces seed set
- Orchard access and erosion benefits

- **Disadvantages.**

- Frost potential
- Weeds still use water and nutrients
- Favors low growing and perennial weeds
- Favors grasses (*advantages or disadvantages?*)
- Cost of repeat operations (slow and frequent)

Chemical control

Herbicides

- CA orchards and vineyard herbicides usually applied to “strips” under the tree/vine row
 - 2-20 ft strip, may treat 20-50% of the floor
 - Middles managed with mowing, tillage, or less intensive herbicide program
 - Often with a “preharvest” broadcast application

Types of herbicides

- Preemergence (PRE)
 - Applied to bare soil and affect germinating seeds and seedlings
 - Provide residual effects (weeks or months)
- Postemergence (POST)
 - “Burn down” treatments applied to the foliage of emerged weeds
 - Can be “contact” or “translocated” materials
 - Some products have residual control, some do not

Factors affecting herbicide choice

- Availability in the crop (registration)
- Weeds to be controlled (weed ID)
- Toxicity and safety (to crop and non-target)
- Soil type and texture
- Cost

Notes: R = Registered, N = Not registered, NB = no bearing. This chart is intended as a general guide only. Always consult a current label before using any herbicide as labels change frequently and often contain special restrictions regarding use of a company's product.

*Trade names for example only
** Registered in NB pistachio only

CA pistachio herbicide use

	Top active ingredients (2017)	2011 treated acreage	2017 treated acreage
1	glyphosate	270,608	392,611
2	glufosinate (Rely 280)	54,223	144,085
3	oxyfluorfen (Goal, Goaltender)	104,900	141,966
4	saflufenacil (Treevix)	43,674	139,040
5	paraquat (Gramoxone)	27,725	84,066
6	pendimethalin (Prowl H2O)	47,393	65,302
7	rimsulfuron (Matrix)	21,791	42,164
8	indaziflam (Alion)	6,552	40,691
9	pyraflufen (Venue)	2,056	34,599
10	carfentrazone (Shark)	6,514	27,135
11	flumioxazin (Chateau)	28,224	22,435
12	penoxsulam (PindarGT)	16,017	20,459
13	clethodim (SelectMax)	284	16,887
14	oryzalin (Surflan)	29,951	12,296

* strip treatments!

Acreage: 2011 ~226k; 2017~335k

Conventional herbicides

ADVANTAGES

- Can be very cost effective (in some cases)
- Consistent results
- Ease of application (speed)
- Crop safety (generally)
- Erosion benefits (vs tillage)
- Season-long control with some products and combos
- Selectivity can be used to maintain desired cover

DISADVANTAGES

- Cost (in some cases)
- Potential for off-site movement with some products
- Regulations and record keeping
- Herbicide resistance can occur
- Crop injury can occur
- Some market sectors have preference against

Herbicide application considerations

- PRE, POST, or PRE/POST mix?
- Tank mixes
- Weed spectrum controlled
- Surfactants and adjuvants
- Coverage (GPA)
- Timing and weed size
- Sprayer calibration (esp. OC nozzles)
- Nozzle selection
- Litter and debris
- Check current herbicide labels
- Scouting and record keeping
- Training and PPE for handlers and applicators
- Potential for off-site movement?
- Double check calculations and recommendations!

Weed challenges in orchards

- Old favorites:
 - Normal mix of annual grasses and broadleaves
 - Challenge with perennial weeds, especially in new orchards or crops with fewer herbicide options
- New weed problems
 - Most of the “new” issues seem to be related to glyphosate resistance and/or shifting populations to tolerant species
- Changing control options
 - Less tillage, some new herbicides, water issues

Extra challenges in young orchards

- Crop less competitive with weeds
- Greater sensitivity to weed competition
- Greater sensitivity to injury from weed control tactics
- Fewer herbicides registered on new plantings

Orchard weed management

- Weed ID
 - Understand the problem and biology
- Use integrated management tactics
 - Cultural and mechanical approaches
 - Chemical tactics
 - Right herbicide, right target, right time
 - Resistance management considerations
 - Environmental impacts
 - VOC, surface water, ground water

Manage “your” weeds

- Weed management is an annual concern and production cost that must be considered in a local context
- No “one size fits all” solution for all orchards - integrated weed management requires systemic and long-term thinking

T&V herbicide registrations

Herbicide Registration on California Tree and Vine Crops - (updated March 2020 - UC Weed Science)

Herbicide-Common Name (example trade name)	Site of Action Group ¹	Almond	Pecan	Pistachio	Walnut	Apple	Pear	Apricot	Cherry	Nectarine	Peach	Plum / Prune	Avocado	Citrus	Date	Fig	Grape	Kiwi	Olive	Pomegranate
